I agree with Karl, a building of this size would have several chimneys, unless you picture most of it being unheated storage.

Mike

I'm thinking the main floor is part office/part storage. The second story could also be office space, and share the same chimney for its stove?

A better explanation (excuse :-)) Single boiler on the ground floor, steam radiators through the office sections.

The two long sides are elongted, and I started on one of the short sides. Another hour or so to go tomorrow, and then I'll run caps along the corners (probably here shortly).

Nice, that's a beautiful building. Nice work. Chimneys could be leftovers from a previous era, at least that gives you an excuse to install them if you want.

But I model "the previous era" :-) (My layout is set in the 1890s.)

Dave,
Great work on a difficult roof to model

Looking mighty fine, Dave.

Cheers, Mark.

A wee bit of paint touch-up is needed, plus the porches, but the structure is done!

And a look at the other side through the layout underneath the stairs:

Overall, happy with how this came out, although particularly when looking closely at photos, I can see where I should have done better.

Nice, those dormers really add to the look of the building.

George

Before each flight, make sure that your bladder is empty and your fuel tanks are full.

Dave,
That's a very well done complex of buildings. Your latest is a nice addition.

Over at MDH Forums, I got a good suggestion for how to estimate the amount of mold material to fill the mold box: Pack the mold box with dry rice (just like rice vs. lead shot for weighting), and then pour the rice into a measuring cup.

I'm doing some 'longscewing' for the relatively shallow shelf run of track along the other side of the staircase. The outside corner here is near where the Brickworks Office goes to the left. My concept is for the road from the the office to dip, curve around the outside corner, and into a valley. The road slowly climbs out of the valley back up to track level at the far right. A T-junction has the other branch of the road proceeding under the tracks with a bridge to be cut in and built.

The outside corner. The bridge would go just to the right of where the scissors are. There's a piece of Fastrack just hanging in mid-air in front of the flats, that has a road divider/road sign.

A view along the entire run, with the backdrops temporarily in place.

Flats mocked up. This gives you a better sense of the roughly 16" deep benchwork.

Thoughts and comments very much welcome!

Dave,
That will be another nice scene.
What are you planning to use for a coal ramp? I have an unused Lean-to PRR coal ramp that you're welcome to. (https://www.walthers.com/premiwash-...ard-n-scale)

That should fit quite nicely. I wanted to check length and height.

Some more playing around with wall pieces:

That wall that's mostly a stone wall that just stays to the left is from Merchants Row II, the one that has the bay windows on the corner. I think that'll work well somewhere along that row to provide some standoffishness from the backdrop/view of flats. Some of the window bracing is broken on that piece, but I can rework that. And it'll give me something to do while mulling over the rest of this area.
